
Chad Super Aluminum Electrolytic Capacitor

What is an aluminum electrolytic capacitor?

An aluminum electrolytic capacitor consists of a wound capacitor element, impregnated with liquid electrolyte, connected to terminals and sealed in a can. See Figures 1 and 2. Voltage ratings are classified as < 100 VDC for low voltage, 101-250 for mid-voltage and 251-700 for high voltage.

Can aluminum electrolytic capacitors withstand rapid charging?

Aluminum electrolytic capacitors can generally withstand rapid charging along with occasional overvoltage transient spikes of limited energy. If transients above the capacitor's rated DC voltage are anticipated in the application, please contact us to discuss the best capacitor for the application.

What is a cathode in an aluminum electrolytic capacitor?

In contrast to other capacitors, the counter electrode (the cathode) of aluminum electrolytic capacitors is a conductive liquid, the operating electrolyte. A second aluminum foil, the so-called cathode foil, serves as a large-surfaced contact area for passing current to the operating electrolyte.

What is the anode of an aluminum electrolytic capacitor?

The anode of an aluminum electrolytic capacitor is an aluminum foil of extreme purity. The effective surface area of this foil is greatly enlarged (by a factor of up to 200) by electrochemical etching in order to achieve the maximum possible capacitance values.
