What is compressed air energy storage (CAES)?

As the world transitions to decarbonized energy systems, emerging long-duration energy storage technologies are crucial for supporting the large-scale deployment of renewable energy sources. Compressed air energy storage (CAES) is a promising solution for large-scale, long-duration energy storage with competitive economics.

What is multi-energy storage performance?

Multi-energy storage performance under different scenarios: (a) Lithium iron phosphate battery energy storage, (b) pumped storage, (c) compressed air energy storage, and (d) hydrogen energy storage. The EES for the renewables scenario focuses on the economic indicators of energy storage.

How much does stored electricity cost?

A number of recent techno-economic studies have estimated CAES-based stored electricity costs at \$0.15 to \$0.60/kWh. The Framework Study identifies promising RD&D pathways to reduce the levelized cost of storage (LCOS) of key storage technologies.

How do economic parameters affect energy storage performance?

On this basis, the economic parameters are incorporated into the multi-energy storage selection system, and the improved G1-EWM weight method and fuzzy comprehensive evaluation method are used to systematically analyze the differential performance of energy storage technology on the source, network, and load sides in multi-application scenarios.
