# Does the solar panel assembly include an inverter

Do solar panels have inverters?

Solar panels generate direct current (DC) electricity, but your home runs on alternating current (AC). An inverter's job is to convert DC electricity into usable AC, so your solar system can power your home's lights, appliances, and more. While inverters aren't a part of the panel's physical construction, they're a critical component.

What type of electricity does a solar inverter produce?

The electricity generated by solar panels is direct current (DC), but most homes and businesses use alternating current (AC). The inverter is the crucial component that converts DC electricity from your solar panels into usable AC electricity for your appliances or the grid. 2.1. Types of Inverters

What are the different types of solar inverters?

While inverters aren't a part of the panel's physical construction, they're a critical component. The two main types of inverters used in home solar systems are string inverters and microinverters. String Inverters: With this setup, a group or "string" of solar panels is connected to a single, centralized inverter.

What does a solar inverter do?

A solar inverter is an important part of any solar power system. It primarily converts the direct current (DC) electricity generated by solar panels into alternating current (AC), where AC electricity is used for powering household appliances, or it can be fed into the power grid. Or to directly answer "What's an inverter?"
