# Energy storage and new energy require conditions

Why do we need energy storage systems?

The worldwide energy transition driven by fossil fuel resource depletion and increasing environmental concerns require the establishment of strong energy storage systems to mitigate the intermittency issues of renewable energy sources. ESS technologies are crucial in maintaining grid stability supply-demand balance and supporting energy demand.

Should energy storage be encouraged?

It must be ensured that the cost of electricity encourages or rewards energy storage. For instance, it should be advantageous to store and sell energy back to the grid when there is a lot of renewable energy and more expensive when there isn't measures as shown in Fig. 10 [105,106,107,108].

Do energy storage systems need an enabling environment?

In addition to new storage technologies, energy storage systems need an enabling environment that facilitates their financing and implementation, which requires broad support from many stakeholders.

Are energy storage systems enabling technologies?

Energy Storage Systems (ESS) have proven to be enabling technologies. They address these limitations by stabilizing the grid, optimizing supply demand dynamics and enhancing the integration of renewable resources.
