
Power grid measures electricity prices of energy storage power stations

What is the unified operation model of the power grid?

In the unified operation model of the power grid, the operation cost and reasonable return of the pumped storage power station are included in the sales price of the power grid company, and the cost is recovered through the sales price.

How can pumped storage power stations be fully independent?

In the model of "completely independent participation in the market", the technical transformation of the pumped storage power station should be accelerated, the energy conversion efficiency of the power station should be reasonably improved, the power loss should be reduced, and the cost recovery of the power station should be promoted.

What are the development models of pumped storage power stations?

According to the different stages of the development of the power market, this paper puts forward the corresponding development models of pumped storage power stations, which are successively the "two-part price system" model, the "partial capacity fixed compensation" model, and the "completely independent market participation" model.

What factors affect the economic benefits of pumped storage power stations?
