
Solar inverter off-grid and grid-connected

What is a grid connected solar inverter?

This type of inverter is suitable for remote areas with unstable power supply or no access to the power grid. A grid-connected solar inverter is a device that converts the direct current output by solar panels into alternating current and directly supplies it to the power grid.

What is an off-grid solar inverter?

An off-grid solar inverter, as the name suggests, is built for environments where grid power is either unavailable or intentionally avoided. These inverters are the core component of fully self-sufficient energy systems, converting solar DC power into usable AC while operating independently from any utility connection.

What is an off-grid hybrid inverter?

Commonly known as an off-grid hybrid inverter, it combines solar + battery + optional grid power, ensuring uninterrupted energy supply. Ideal for users in regions with occasional grid access who prioritize solar autonomy but value backup flexibility.

What is an on-grid inverter?

On-grid inverters, also known as grid-tied inverters, are designed to operate with the public electricity grid. These inverters convert the direct current (DC) generated by solar panels into alternating current (AC), which is used by most household and commercial appliances.
