# What are the two types of solar inverters

What are the different types of solar inverters?

There are two common types of inverters: a string or central inverter, and microinverters like the Enphase IQ8. String inverters connect multiple solar panels in a series. Power is routed to a single inverter, where it's converted to AC, then distributed to your main electrical panel and out to your home.

Are all solar inverters the same?

All inverters serve the same purpose but on different scales because some of them are fit for small-scale systems whereas others are ideal for large-scale operations like solar farms. Solar inverter working principle is the same irrespective of its type because it will use DC from solar panels and convert it to AC.

Do solar panels need inverters?

As we mentioned in the previous section, solar panels need inverters to convert sunlight into usable electricity (DC to AC). There are two common types of inverters: a string or central inverter, and microinverters like the Enphase IQ8. String inverters connect multiple solar panels in a series.

What type of inverter do I Need?

If you want backup power with a grid-tied system, you have options with all inverter types: Microinverter Systems: Use AC-coupled battery solutions with separate inverters for solar and batteries String and Optimizer Systems: Typically use DC-coupled solutions with hybrid inverters that handle both solar and battery functions
