# Wind power transmission and supply system

Which transmission system is used in wind turbine?

Normally, the mechanical transmission system (gear train) is used to transmit the power in wind turbine. But this transmission is not suitable in large scale power production. Currently, hydraulic power system has drawn an attention as a power transmission system in the wind turbine field.

What is power transmission in a wind turbine rotor?

The power transmission from the turbine rotor to the generator is an important and integral part of the wind turbine system. Generally, the power transmission unit is of two types, e.g., mechanical transmission system and hydrostatic power transmission system (HST).

What is a wind power system?

A wind power system integrates different engineering domains, i.e. aerodynamic, mechanical, hydraulic and electrical. The power transmission from the turbine rotor to the generator is an important and integral part of the wind turbine system.

Is there a light offshore wind power transmission system?

The DolWin5 project, currently under construction in Germany, is the world's first DC transmission project without an offshore booster, thus exploring viable ideas for light offshore wind power transmission. Fig. 1. Europe offshore wind power DC transmission system plan.
